Disinfectants on PMMA surfaces

Ladies and gentlemen,

We are currently receiving more and more enquiries from the market regarding the disinfection of laminated window profiles.

In this context, we would like to draw your attention to the following:

According to the chemical resistance in the technical data sheet of our products, these are **not compatible with disinfectants** that according to the WHO have an efficacy on Covid-19 (high ethanol/isopropanol content of 70% or more).

The transparent PMMA protective layer commonly available on the market, which contributes to the high weathering stability of our products, is not resistant to such a high concentration of these substances.

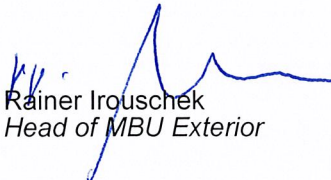

The use of such disinfectants can cause damage to the PMMA film, for which we as the manufacturer accept no liability.

We therefore strongly advise against treating laminated window profiles with a PMMA coating with such disinfectants.

Cleaning according to our cleaning recommendations is of course still possible.

Exceptions are our woodec range and our new mattex range (F470- and F476-), which can be cleaned with such disinfectants without hesitation due to their PVDF surface.

Sincerely,

Rainer Irouschek
